

MICROSOFT AZURE + SNOWFLAKE

Snowbridge

Governed AI access to Snowflake operations

Ask in business language. Review the plan. Approve before execution.

BUSINESS OVERVIEW

Live on Azure Container Apps

The integration gap is a governance gap

Business demand

Fast answers from operational data

Users want simple questions answered without learning SQL, credentials, or connector details.

SNOWBRIDGE

One governed interface

Intent translated into approved operations and validated parameters.

Enterprise control

Predictable, reviewable execution

Allowlisted operations, explicit approval, parameter validation, managed identity, and stable API contracts.

NO MODEL-GENERATED SQL

Business value, built into the interaction

1

stable interface

A common contract for business UI and technical integrations.

0

generated SQL

The model never writes or submits arbitrary Snowflake queries.

3

approved operations

Echo, current context, and warehouse usage summary today.

1

human approval gate

Execution requires explicit confirmation of the reviewed plan.

The result: speed for the user without surrendering control to the model.

AI interprets intent; application code controls execution

Nothing runs until the reviewed plan is explicitly confirmed.

The approval boundary is visible to the user

S Snowbridge Service available [API documentation](#)

Ask Snowflake, safely.

Turn business questions into governed operations, review what will run, and approve execution before data is accessed.

BUSINESS QUESTION
What would you like to know?

Describe your request in plain language

Show warehouse usage for the last 7 days

7-day usage 30-day usage Current context Connectivity test

Create governed plan Start over

APPROVED OPERATION
warehouse usage summary

PARAMETERS
days: 7

User requested warehouse usage summary for the last 7 days, which matches the warehouse_usage_summary operation with days parameter set to 7.

Approve and execute

GOVERNED WORKFLOW
Human approval stays in control

- 1 **Ask**
State the business need without writing SQL.
- 2 **Review**
AI selects only from approved operations and parameters.
- 3 **Approve**
Nothing executes until you explicitly confirm the plan.
- 4 **Use the result**
Receive structured data ready for downstream workflows.

Demo environment - Mock Snowflake data

1 PLAIN LANGUAGE

The user asks a business question without writing SQL.

2 REVIEW

The approved operation and parameters are shown before execution.

3 APPROVE

A deliberate action supplies the confirmation required by the API.

A compact Azure foundation with clear trust boundaries

Defense in depth, not model confidence

1 Allowlisted operation catalog

2 Deterministic parameter validation

3 Explicit human confirmation

4 Parameterized connector-owned SQL

The model cannot bypass the catalog, invent parameters, or execute directly.

A three-minute customer demonstration

- | | | |
|-----------|----------------|--|
| 01 | Ask | "Show warehouse usage for the last 7 days." |
| 02 | Review | Point out the approved operation and days parameter. |
| 03 | Approve | Explain that execution requires explicit confirmation. |
| 04 | Result | Show the structured two-row mock result. |

Open the live Snowbridge demo →

Start governed. Expand deliberately.

The MVP proves the control model before expanding the operation catalog and connecting a production Snowflake account.
